

Securicom SSL VPN Service

securi·protect

Securicom SSL VPN is a highly customisable and secure SSL Virtual Private Network (VPN) solution/service that provides:

- Mobile workers with secure access to business applications and resources such as emails and files when they're not connected to the company network
- Multi-factor user authentication for optimal security
- Host checking to force an end users machine to conform to company policies
- Advanced capabilities for managing all risks associated with VPN
- Comprehensive reports on user traffic and activity on the system
- OS support includes Windows XP, Vista, 7, Mac OSX, Linux.

No special system requirements

Securicom SSL VPN is fully-hosted and managed in the cloud, at a secure data centre by Securicom. Companies subscribe to the service which means:

- No capital outlay
- Low cost of ownership
- Securicom manages the installation
- 24/7/365 monitoring and support by Securicom's security experts
- Top level security at Securicom's data centre
- Securicom manages upgrades and maintenance to the system

Secure, customisable, simple

Securicom's SSL VPN is based on industry-leading technologies and minimal set-up is required from the user's side. The service can be customised to suite an organisation's specific VPN requirements. Remote and mobile users have access to company applications and resources via a highly-secure and easy-to-use web-based interface using any internet-enabled device.

Securicom SSL VPN runs pre-defined customer specific corporate compliancy checks on all users accessing company resources via the Host Checker feature, checking for installed software and even forcing AV updates. This ensures access compliance and that every connected device is fully patched and protected before entering the corporate network.

Clients can also create user profiles to manage and control the level of access users have to company applications and resources.

Securicom's VPN advantage
